

Objective-C Runtime / ...

Protocol

NSObjectProtocol

The group of methods that are fundamental to all Objective-C objects.

iOS | iPadOS | Mac Catalyst | macOS | tvOS | visionOS | watchOS

protocol NSObjectProtocol

Overview

Note

This protocol is imported into Swift with the name `NSObjectProtocol`.

An object that conforms to this protocol can be considered a first-class object. Such an object can be asked about its:

- Class, and the place of its class in the inheritance hierarchy.
- Conformance to protocols.
- Ability to respond to a particular message.

The Cocoa root class [NSObject](#) adopts this protocol, so all objects inheriting from [NSObject](#) have the features described by this protocol.

Topics

Identifying Classes

```
var superclass: AnyClass?
```

Returns the class object for the receiver's superclass.

Required

Identifying and Comparing Objects

```
func isEqual(Any?) -> Bool
```

Returns a Boolean value that indicates whether the receiver and a given object are equal.

Required

```
var hash: Int
```

Returns an integer that can be used as a table address in a hash table structure.

Required
